

PCTF Verified Login Component Overview Draft Recommendation V1.0

This Draft Recommendation has been developed by the [Digital ID & Authentication Council of Canada](#) (DIACC) Trust Framework Expert Committee (TFEC). The TFEC operates under the controlling policies of the DIACC. Comments submitted by the public are subject to the [DIACC Contributor Agreement](#).

DIACC expects to modify and improve this Draft Recommendation based upon public comments. The purpose of the open commentary is to ensure transparency in development and diversity of truly Pan-Canadian input. Comments made during the review will be considered for incorporation to the next draft. DIACC will prepare a disposition of comments to provide transparency with regard to how each comment was handled.

Forthcoming PCTF releases will expand, clarify, and refine the content of this document.

The intended target audience for this Draft Recommendation are decision makers who may or may not be domain technology experts. When reviewing this draft, please consider the following and note that responses to these questions are non-binding and serve to improve the Pan-Canadian Trust Framework.

1. If your organization were to self-assess today, would you comply?
2. Could your organization comply?
3. Could your organization identify any barriers to compliance (business, legal, or technical)?
4. Would you be willing to complete a non-binding self-assessment? If so, would you be willing to share those results with the DIACC Trust Framework Expert Committee.
5. Is the description of the Trusted Processes clear and accurate?
6. Are the conformance criteria clear and measurable/assessible?
7. Do you agree with the terms used to describe Verified Login and the use of the phrase "Verified Login" for this component?
8. Do you agree with the removal of descriptive information from the conformance profile document and its consolidation in the overview document?
9. Do you agree with the re-structuring of the overview document to put all terms, definitions, roles, and other key information into a single section?

66 1 Introduction to the PCTF Verified 67 Login Component

68 This document provides an overview of the PCTF Verified Login Component, a component of
69 the Pan-Canadian Trust Framework (PCTF). For a general introduction to the PCTF, please see
70 the PCTF Model Overview. The PCTF Model Overview provides the PCTF's goals and
71 objectives, a high-level model outline of the PCTF, and contextual information.

72 Each PCTF component is made up of two documents:

- 73 1. Overview – Introduces the subject matter of the component. The overview
74 provides information essential to understanding the Conformance Criteria of the
75 component. This includes definitions of key terms, concepts, and the Trusted Processes
76 that are part of the component.
- 77 2. Conformance profile – Specifies the Conformance Criteria used to standardize and
78 assess the integrity of the Trusted Processes that are part of the component.

79 This overview provides information related to and necessary for consistent interpretation of the
80 PCTF Verified Login Conformance Profile.

81 1.1 Scope

82 The PCTF Verified Login Component defines:

- 83 1. A set of processes that enable access to digital systems. Processes in scope for this
84 component include binding a Credential to a Subject, binding Authenticators to a
85 Credential, session management, and Credential lifecycle management functions (e.g.,
86 updates, suspension, recovery, and revocation).
- 87 2. A set of Conformance Criteria for each process that, when a process is shown to be
88 compliant, enable the process to be trusted.

89 1.2 Purpose and Anticipated Benefits

90 The purpose of the PCTF Verified Login Component is to ensure the on-going integrity of login
91 processes by applying standardized Conformance Criteria for process assessment and
92 certification. The Conformance Criteria for this component may be used to ensure:

- 93 • Trusted Processes result in the representation of a unique Subject and a Level of
94 Assurance that it is the same Subject with each successful login to an Authentication
95 Service Provider.
- 96 • The reliability of Trusted Processes needed to maintain the integrity and security of the
97 Authenticators used to gain access to remote systems.

98

99 All participants will benefit from:

- 100 • Repeatability and continuity in the login processes that they offer or on which they
101 depend.
- 102 • Assurance that identified Users can engage in authorized interactions with remote
103 systems.

104 Relying Parties benefit from:

- 105 • The ability to build on the assurance of the Verified Login Trusted Processes to uniquely
106 identify a Subject within their application or program space.

107 **1.3 Biometrics and Verified Login**

108 Given the inherent lack of revocability of biometrics, industry standards relevant to this
109 component generally regard biometrics as a means to unlock an Authenticator within a local
110 device to facilitate remote Authentication with a service. An example of such a scenario is
111 someone using Apple's TouchID or FaceID to unlock access to a mobile one-time passcode or
112 other locally stored and generated mobile Authenticator.

- 113 • **NIST 800-63** describes the use of biometrics as follows: "A biometric also does not
114 constitute a secret. Accordingly, these guidelines only allow the use of biometrics for
115 authentication when strongly bound to a physical authenticator."
- 116 • **ITSP.30.031** describes the use of biometrics as follows: "Something a user is or does
117 may be replicated. A threat actor may obtain a copy of the token owner's fingerprint and
118 construct a replica - assuming that the biometric system(s) employed do not block such
119 attacks by employing robust liveness detection techniques." and "Automated recognition
120 of individuals based on their behavioural and biological characteristics. In this document,
121 biometrics may be used to unlock authentication tokens and prevent repudiation of
122 registration."

123 Based upon the above guidance from NIST and ITSP, this version of PCTF Verified Login
124 Component considers biometric Authentication only in the context of unlocking access to
125 another Authenticator, with the most popular example being unlocking access through biometric
126 to a mobile Authenticator.

127 **1.4 Relationship to the Pan-Canadian Trust Framework**

128 The Pan-Canadian Trust Framework consists of a set of modular or functional components that
129 can be independently assessed and certified for consideration as trusted components. Building
130 on a Pan-Canadian approach, the PCTF enables the public and private sector to work
131 collaboratively to safeguard digital identities by standardizing processes and practices across
132 the Canadian digital ecosystem.

133

134 Figure 1 is an illustration of the components of the draft Pan-Canadian Trust Framework.

135

136 **Figure 1. Components of the draft Pan-Canadian Trust Framework**

137 The benefits associated with the PCTF Verified Login Component are realized in part by
138 expanding on processes defined in the PCTF Verified Person Component (and, to some extent,
139 the PCTF Verified Organization Component). In this regard, the PCTF distinguishes between
140 “verification” and “authentication” processes and recognizes that Authenticated Sessions remain
141 necessary to ensure security and privacy online.

142 2 Verified Login Conventions

143 This section describes and defines key terms and concepts used in the PCTF Verified Login
144 Component. This information is provided to ensure consistent use and interpretation of terms
145 appearing in this overview and the PCTF Verified Login Conformance Profile.

146 For the purposes of this PCTF component:

- 147 • The term Login does not refer exclusively to a preferred authentication method (e.g.,
148 username/password) or technology (e.g., cryptographic keys vs. biometrics).
- 149 • The Trusted Processes defined for this component are agnostic with respect to how
150 digital IDs are issued and managed. In this sense, digital IDs issued and managed using
151 self-sovereign identity or more conventional issuance processes may take advantage of
152 this component.

153 Note

- 154 • Conventions may vary between PCTF components. Readers are encouraged to review
155 the conventions for each PCTF component they are reading.
- 156 • Defined Terms – Key terms and concepts described and defined in this section, the
157 section on Trusted Processes, and the PCTF Glossary are capitalized throughout this
158 document.

- 159 • Hypertext Links – Hypertext links may be embedded in electronic versions of this
160 document. All links were accessible at time of writing.

161 **2.1 Terms and Definitions**

162 For purposes of this PCTF component, terms and definitions listed in the PCTF Glossary and
163 the terms and definitions listed in this section apply.

164 **Adaptive Risk**

165 Dynamic measure of the risk associated with a transaction or service access based on context
166 and behaviour.

167 **Adaptive Risk Authentication**

168 Dynamically adjusting the specific authentication steps performed according to the Adaptive
169 Risk.

170 **Authentication Factors**

171 There are three Authentication Factors:

- 172 1. Something the Subject has
173 2. Something the Subject knows
174 3. Something the Subject is or does

175 **Authenticator**

176 Information or biometric characteristics under the control of an individual that is a specific
177 instance of an Authenticator Type; the specific instance of the Authenticator Type that is under
178 the control of the individual.

179 Examples:

- 180 1. Private signing key equal to 011011101010101011000101
181 2. Password that is equal to A\$45!R78oR
182 3. Person's face (note: the face image is captured and potentially further processed in
183 preparation for analysis against authenticator validation data)

184 **Authenticator Type**

185 A class of authenticator within a specified authentication factor.

186 Examples:

- 187 1. Crypto keys & RSA one-time-password (OTP) token – Something you have
188 2. Passwords & knowledge-based authentication (KBAs, e.g., responses to challenge
189 questions) – Something you know

190 3. Fingerprints, retinas, keyboard stroke timing, gait – Something you are

191 **Authenticator Validation Data**

192 Data under the control of a service provider against which the authenticator (provided by a
193 Subject during an authentication attempt) is validated.

194 Examples:

- 195 1. Public signature validation key (associated with Subject private key) equal to
196 0010011010111111010000
- 197 2. Hash of Subject's password A\$n45!R78oR or current state of a one-time password
198 (OTP) generator
- 199 3. Subject's enrolment facial image (or biometric template of Subject's enrolment facial
200 image, depending on what is stored by the Credential Service Provider)

201 **Credential**

202 Data that uniquely binds Authenticator Validation Data to identity data. For the purposes of this
203 PCTF component, "Credential" only refers to digital data structures.

204 Examples:

- 205 1. Subject's driver's license number (plus possibly other data record pointers) binds the
206 Subject's transport ministry identity record to the Subject's face image/biometric
207 template in transport ministry's biometric database
- 208 2. Subject's bank account number binds the Subject's identity data at the bank with the
209 hash of the Subject's bank account password

210 **Independently Audited**

211 The referenced audit must be performed by an audit group that is unconnected to, discrete
212 from, or otherwise not part of the business unit responsible for the process or activity that is the
213 subject of the audit.

214 **IT Service Management**

215 The entirety of activities – directed by policies, organized and structured in processes and
216 supporting procedures – that are performed by an organization to design, plan, deliver, operate
217 and control information technology services offered to customers.

218 **Note**

- 219 • See Appendix A for an example use case that illustrates how some of the above terms
220 are used in the PCTF Verified Login Component.

221

222 2.2 Abbreviations

223 The following abbreviations and acronyms appear throughout this overview and the PCTF
224 Verified Login Conformance Profile:

- 225 • DIDs – Decentralized Identifier(s)
- 226 • IETF – Internet Engineering Task Force
- 227 • IT – Information technology
- 228 • ITIL – Information Technology Infrastructure Library
- 229 • ITSP – IT Security Guidance for Practitioners
- 230 • LOA(s) – Level(s) of Assurance
- 231 • NIST – National Institute of Standards and Technology
- 232 • OTP – One-time password
- 233 • PCTF – Pan-Canadian Trust Framework
- 234 • Q&A – Question(s) and Answer(s)
- 235 • TLS – Transport Layer Security
- 236 • W3C – World Wide Web Consortium

237 2.3 Roles

238 The following roles and role definitions are applicable in the scope and context of the PCTF
239 Verified Login Component. These roles help to isolate the different functions and responsibilities
240 within the end-to-end Verified Login Trusted Processes.

241 Note

- 242 • Depending on the use case, different organizations may assume one or multiple
243 roles. For example, Credential Issuance may be the responsibility of one organization,
244 while Authentication may be the responsibility of a different organization.
- 245 • Role definitions do not imply or require any particular solution, architecture, or
246 implementation or business model.

247 Authentication Service Provider

248 An entity that operates a service that implements the Verified Login Trusted Processes related
249 to authentication:

- 250 1. Authentication
- 251 2. Authentication Session Initiation (optional)
- 252 3. Authentication Session Termination (optional)

253 Credential Service Provider

254 An entity that operates a service that implements the Verified Login Trusted Processes related
255 to credential management:

- 256 1. Credential Issuance
- 257 2. Credential Suspension

- 258 3. Credential Recovery
- 259 4. Credential Maintenance
- 260 5. Credential Revocation

261 **Relying Party**

262 An entity that depends on a conforming implementation of the Verified Login Trusted Processes.

263 **Subject**

264 A Subject may be a natural person, an organization, an application, or a device bound to a
265 credential.

266 **2.4 Levels of Assurance**

267 A Level of Assurance is an indicator that must be applied and maintained to describe a level of
268 confidence in the PCTF Verified Login Component Trusted Processes. In the context of this
269 PCTF component, Credential Providers, Relying Parties, and Users use LOAs to determine
270 what degree of confidence the access to a digital system should have given the context of the
271 ensuing digital interaction. A LOA also indicates that Verified Login processes have been
272 assessed and/or certified in accordance with the PCTF Verified Login Conformance Criteria.

273 For this PCTF component, Conformance Criteria are profiled in terms of LOA; the conformance
274 criteria explicitly list the requirements for each LOA of a process. They specify the requirements
275 and relative stringency of the requirements that must be met to attain a given LOA for a
276 process. It is necessary to comply with all Conformance Criteria for a given LOA for all
277 processes to attain that Level of Assurance. The resultant LOA of any Verified Login system is
278 the lowest LOA associated with any of the Verified Login Trusted Processes. The requirements
279 of each LOA are cumulative – successively higher LOA’s require that the requirements for lower
280 LOA’s have been met as well.

281 Table 1 lists the four Levels of Assurance defined for the PCTF Verified Login Component.

	Level of Assurance	Qualification Description
280-a	Level 1 (LOA1)	<ul style="list-style-type: none"> • Little or no degree of confidence required • Satisfies Level 1 Conformance Criteria
280-b	Level 2 (LOA2)	<ul style="list-style-type: none"> • Some (reasonable) degree of confidence required • Satisfies Level 2 Conformance Criteria
280-c	Level 3 (LOA3)	<ul style="list-style-type: none"> • High degree of confidence required • Satisfies Level 3 Conformance Criteria
280-d	Level 4 (LOA4)	<ul style="list-style-type: none"> • Very high degree of confidence required • Satisfies Level 4 Conformance Criteria

282 **Table 1. Levels of Assurance**

283

284 **Note**

- 285 • This version of the PCTF Verified Login Component does not define Conformance
286 Criteria for LOA 4. However, the PCTF acknowledges the existence of LOA 4 and has
287 included it as a placeholder for future versions.
- 288 • Each LOA may be further refined by a qualifier. For example, a Relying Party in the
289 health care sector may specify in a PCTF Profile a requirement for an LOA3 Credential
290 with a qualifier that the authenticator must be issued by a health care provider.

291 **3 Trusted Processes**

292 The PCTF promotes trust through a set of auditable business and technical requirements for
293 various defined processes.

294 A process is a business or technical activity (or set of such activities) that transforms an input
295 condition to an output condition – an output on which other processes often depend. A condition
296 is a particular state or circumstance that is relevant to a Trusted Process. It may be an input,
297 output, or dependency in relation to a Trusted Process. Conformance Criteria specify what is
298 required to transform an input condition into an output condition. Conformance Criteria specify,
299 for example, what is required for the Credential Issuance process to transform a “No Credential”
300 input condition to an “Issued Credential” output condition.

301 In the PCTF context, a process is designated a Trusted Process when it is audited and certified
302 as conforming to Conformance Criteria defined in a PCTF conformance profile. The integrity of
303 a Trusted Process is paramount because many participants—across jurisdictional,
304 organizational, and sectoral boundaries and over the short-term and long-term—rely on the
305 output of that process.

306 **The PCTF Verified Login Component defines eight Trusted Processes:**

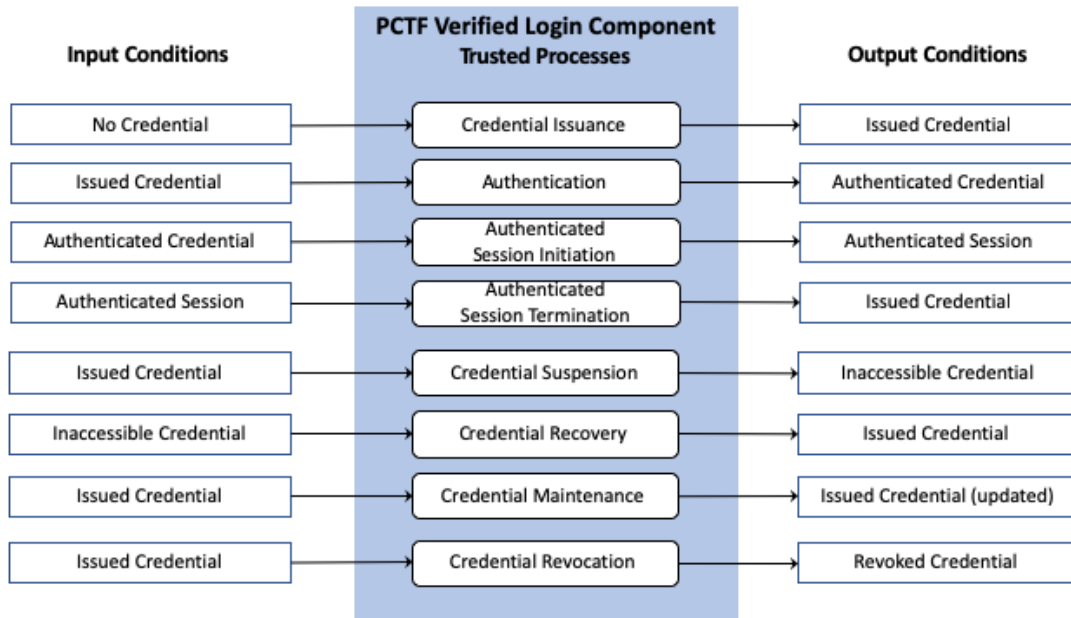

- 307 1. Credential Issuance
- 308 2. Authentication
- 309 3. Authenticated Session Initiation
- 310 4. Authenticated Session Termination
- 311 5. Credential Suspension
- 312 6. Credential Recovery
- 313 7. Credential Maintenance
- 314 8. Credential Revocation

315 A Verified Login process is designated a Trusted Process when it is audited and certified
316 according to Conformance Criteria stipulated by the PCTF Verified Login Component
317 Conformance Profile. Conformance Criteria specified in other PCTF components of may also be
318 applicable under certain circumstances.

319

320 3.1 Conceptual Overview

321 Figure 2 provides a conceptual overview and the logical organization of the PCTF Verified Login
322 Component Trusted Processes.

323

324 **Figure 2. Verified Login Component Conceptual Overview**

325 3.2 Process Descriptions

326 The following sections define PCTF Verified Login Component Trusted Processes. The PCTF
327 Verified Login Conformance Profile specifies the Conformance Criteria against which the
328 trustworthiness of these processes can be assessed.

329 Verified Login Trusted Processes are defined using the following information:

- 330 1. Description – A descriptive overview of the process (the opening paragraphs)
- 331 2. Inputs – What is put in, taken in, or operated on by the process
- 332 3. Outputs – What is produced by or results from the process
- 333 4. Dependencies – Related Trusted Processes, primarily those that produce outputs on
- 334 which the process depends

335 Note

- 336 • Inputs and outputs are both types of conditions (conditions being particular states or
- 337 circumstances that are relevant to a Trusted Process). In this section, the input and
- 338 output conditions are relevant to Verified Login.

339 **3.2.1 Credential Issuance**

340 Credential Issuance is an enrolment process, during which a Credential has been issued, bound
341 to a single Subject, and bound to one or more appropriate Authenticators controlled by the
342 Subject. The Authenticators may be issued during this process, provided by the Subject, or
343 provided by a third party. The Authenticators will be subsequently used to prove, with the
344 specified Level of Assurance, that a Credential is referring to the same Subject that was
345 originally bound to the Credential. A Credential includes one or more identifiers which may be
346 pseudonymous and may contain attributes verified by the Credential issuer.

347 **Note**

- 348 • Validation and verification of the Subject’s identity are not part of this process. The
349 validation and/or verification of the Subject’s identity when required is addressed by
350 processes in the PCTF Verified Person Component.

351 **Inputs** No Credential – There is no Credential assigned to the Subject.

352
353 **Outputs** Authenticated Session – A persistent interaction between a Subject and
354 an end-point.

355 **Dependencies** Authentication

356 **3.2.2 Authentication**

357 Authentication is defined in the Government of Canada’s Guideline on Defining Authentication
358 Requirements (section 1.3) [\[1\]](#) as “the process of establishing truth or genuineness to generate
359 an assurance”. It establishes the confidence, or Level of Assurance, that a Subject has control
360 over their Issued Credential and that the Credential is currently valid (i.e., not suspended or
361 revoked). In the event of a revoked or suspended Credential, the output would be a Revoked
362 Credential or Inaccessible Credential, respectively, as the Credential Revocation or Credential
363 Suspension processes would be invoked.

364 **Inputs** Issued Credential – A Credential has been issued, bound to a single Subject,
365 and bound to one or more appropriate Authenticators controlled by the
366 Subject.

367 **Outputs** Authenticated Credential – The Subject has successfully authenticated and
368 proven control of the Credential at the specified LOA.

369 **Dependencies** Credential issuance

370 **3.2.3 Authenticated Session Initiation**

371 A persistent interaction is a session between a Subject and an end-point, such as a Credential
372 provider or Relying Party. A session may be required, for example, to satisfy federation and
373 single sign-on (SSO) use cases. This Trusted Process is optional.

374 Authenticated Session Initiation must begin with an Authenticated Credential. The output of the
375 Authenticated Session Initiation is an Authenticated Session, which is persistent interaction
376 between Subject and end-point. If the authentication process conforms to LOA2, then the

377 Authenticated Session must be considered LOA2. If the authentication process conforms to
378 LOA3, then the Authenticated Session must be considered LOA3.

379 **Inputs** Authenticated Credential – The Subject has successfully authenticated and
380 proven control of the Credential at the specified LOA.
381 **Outputs** Authenticated Session – A persistent interaction between a Subject and an
382 end-point.
383 **Dependencies** Authentication

384 **3.2.4 Authenticated Session Termination**

385 The Authenticated Session Termination process is required when login sessions are used. An
386 Authenticated Session is terminated through such events as an explicit logout event, session
387 expiration due to inactivity or maximum duration, or other means.

388 **Inputs** Authenticated Session – A persistent interaction between a Subject and an
389 end-point.
390 **Outputs** Issued Credential – A Credential has been issued, bound to a single Subject,
391 and bound to one or more appropriate Authenticators controlled by the
392 Subject.
393 **Dependencies** Authenticated Session Initiation

394 **3.2.5 Credential Suspension**

395 This process transitions an Issued Credential to an Inaccessible Credential and may be initiated
396 by a User action, system administrator, or automatically by the system. An Inaccessible
397 Credential is prohibited from use for authentication purposes.

398 **Inputs** Issued Credential – A Credential has been issued, bound to a single Subject,
399 and bound to one or more appropriate Authenticators controlled by the
400 Subject.
401 **Outputs** Inaccessible Credential – The Subject is currently not able to use the
402 Credential. This can be triggered by the Subject (e.g., forgotten password) or
403 the system (e.g., lockout due to successive failed attempts to authenticate,
404 inactivity, suspicious activity). This is a temporary condition which will
405 transition to an issued or revoked Credential.
406 **Dependencies** Credential Issuance
407
408

409 3.2.6 Credential Recovery

410 The Credential Recovery process provides a means to transition an Inaccessible Credential to
411 an Issued Credential. The process may be triggered by a User, system administrator, or
412 automatically by the system.

413 **Inputs** Inaccessible Credential – The Subject is currently not able to use the
414 Credential. This can be triggered by the Subject (e.g., forgotten password) or
415 the system (e.g., lockout due to successive failed attempts to authenticate,
416 inactivity, suspicious activity). This is a temporary condition which will
417 transition to an issued or revoked Credential.
418 **Outputs** Issued Credential – A Credential has been issued, bound to a single Subject,
419 and bound to one or more appropriate Authenticators controlled by the
420 Subject.
421 **Dependencies** Credential Issuance

422 3.2.7 Credential Maintenance

423 The Credential Maintenance process includes life-cycle activities such as binding new
424 Authenticators, removing Authenticators, and updating Authenticators (e.g., password change,
425 updating security questions and answers), or updating Credential attributes. This process is
426 typically initiated by a User, but may also be initiated by a system administrator, or automatically
427 by the system.

428 **Inputs** Issued Credential – A Credential has been issued, bound to a single Subject,
429 and bound to one or more appropriate Authenticators controlled by the
430 Subject.
431 **Outputs** Issued Credential (updated) – A Credential has been issued, bound to a single
432 Subject, and bound to one or more appropriate Authenticators controlled by
433 the Subject.
434 **Dependencies** Credential Issuance Authentication [2]

435 3.2.8 Credential Revocation

436 The Credential Revocation process ensures that a Credential is permanently disabled or
437 deleted. Once a Credential is revoked, it can no longer be used. The system will actively
438 prevent further Trusted Processes from occurring in relation to this Credential. The process can
439 be initiated by a User, system administrator, or automatically by the system. Note that a new
440 Credential can be issued for the same Subject. Re-issue equates to revoking a Credential and
441 issuing a new Credential for the same Subject.

442 **Inputs** Issued Credential – A Credential has been issued, bound to a single Subject,
443 and bound to one or more appropriate Authenticators controlled by the
444 Subject.
445 **Outputs** The Credential is permanently disabled or deleted. This is a permanent
446 condition.
447 **Dependencies** Credential Issuance Authentication [2]

448 **4 References**

449 This section lists all external standards, guidelines, and other documents referenced in this
450 PCTF component.

451 **Note**

452 • Where applicable, only the version or release number specified herein applies to this
453 PCTF component.

454 Instead of developing entirely new standards, the PCTF Verified Login Component builds on
455 and leverages the experience and lessons of organizations outside of DIACC that have
456 developed or are evolving related processes and standards.

457 The PCTF Verified Login Component has taken guidance from and is based in part on the
458 following standards and guidance documents:

- 459 1. [ITSP.30.031 v3 User Authentication Guidance for Information Technology System](#)
460 (ITSP.30.031)
- 461 2. [NIST 800-63-3 Digital Identity Guidelines](#) (800-63-3, 800-63A, 800-63B, and 800-63C)
- 462 3. [Good Practice Guide No. 44 Authentication and Credentials for use with HMG Online](#)
463 [Service](#) (GPG-44)

464 This PCTF component references the following items for exemplary, informational, or illustrative
465 purposes:

- 466 1. [CSEC ITSG-33](#)
- 467 2. [FIPS 140-2](#)

468 **5 Notes**

469 1. Source: Government of Canada, Guideline on Defining Authentication Requirements.
470 <https://www.tbs-sct.gc.ca/pol/doc-eng.aspx?id=26262§ion=html>

471 2. The Authentication Process is a dependency when the process is initiated by a User.

472

473 **Appendix A: Authentication Use Case**

474 **Scenario**

475 Bank authentication for login to government service using bank login (authentication device not
476 known (e.g., browser not known)); bank card number, password, OTP to known address (e.g.,
477 cellphone number, email address).

478 **In this scenario...**

479 Authentication factors are:

- 480 1. Something you know
- 481 2. Something you have

482 Authenticator types are:

- 483 1. (something you know): password
- 484 2. (something you have):
 - 485 1. OTP to known address
 - 486 2. authentication device (e.g., browser) (used in the validation process, but not
487 useful in this example since the browser is not known)

488 Authenticators are:

- 489 1. Subject's actual password
- 490 2. Subject's browser – identified with browser fingerprint
- 491 3. Access to the known address of the Subject (e.g., access to email account of known
492 email address, access to cellphone of known cellphone number, access to physical
493 mailbox)
- 494 4. OTP (as a mechanism to authenticate possession of the known cellphone)

495 Authenticator validation data is:

- 496 1. Browser fingerprint data (for browser that was previously used by Subject)
- 497 2. Hash of Subject's actual password
- 498 3. Known address that was used for OTP distribution to the Subject
- 499 4. Hash of OTP generated during the authentication event (where OTP was sent to
500 cellphone)

501 The credential:

- 502 1. Bank account number (reference to customer information file with identity data)
- 503 2. Reference that links the bank account number to the Subject's authenticator validation
504 data

505

506 **Appendix B: Summary of Trusted**
 507 **Process Conditions**

508 Table 2 summarizes the input and output conditions of the PCTF Verified Login Component.

507-a	Condition	Description
507-b	No Credential	There is no credential assigned to the Subject.
507-c	Issued Credential	A Credential has been issued, bound to a single Subject, and bound to one or more appropriate Authenticators controlled by the Subject.
507-d	Authenticated Credential	The Subject has successfully authenticated and proven control of the Credential at the specified Level of Assurance.
507-e	Authentication Session	A persistent interaction between a Subject and an end-point.
507-f	Inaccessible Credential	The Subject is currently not able to use the Credential. This can be triggered by the Subject (e.g., forgotten password) or the system (e.g., lockout due to successive failed attempts to Authenticate, inactivity, suspicious activity). This is a temporary condition which will transition to an issued or revoked Credential.
507-g	Revoked Credential	The Credential is permanently disabled or deleted. This is a permanent condition.

509 **Table 2. Verified Login Component Conditions**

510 **Appendix C: Summary of Trusted**
 511 **Process Dependencies**

512 Trusted Processes may need to rely on a condition that is the output of another Trusted
 513 Process. This is referred to as a dependency. Table 3 summarizes the inputs, outputs, and
 514 dependencies between the Trusted Processes of the PCTF Verified Login Component.

513-a	Trusted Process	Input Condition	Process Dependency	Output Condition
513-b	Credential Issuance	No Credential	-	Issued Credential
513-c	Authentication	Issued Credential	Credential Issuance	Authenticated Credential
513-d	Authenticated Session Initiation	Authenticated Credential	Authentication	Authenticated Session
513-e	Authenticated Session Termination	Authenticated Session	Authenticated Session Initiation	Issued Credential
513-f	Credential Suspension	Issued Credential	Credential Issuance	Inaccessible Credential
513-g	Credential Recovery	Inaccessible Credential	Credential Issuance	Issued Credential
513-h	Credential Maintenance	Issued Credential	Credential Issuance Authentication ^[2]	Issued Credential (updated)
513-i	Credential Revocation	Issued Credential	Credential Issuance Authentication ^[2]	Revoked Credential

515 **Table 3. Trusted Process Relationships**
